

Starships D6 / Galamara Drives GV-14 D

Dark Avenger Attack Fighter

After the great success of the tt109-a, and predecessor models, Designers at Galamar Yards came to the realization that pirate activities were tough to respond to. After the destruction of the Alliance victory at Endor, Galamar came under attack by pirate forces. The old Jet Scream fighters were fast, but could not respond to attacks quick enough. So in a daring feat of technology, the Galamar decided to use the old idea of Micro-jumping in a system, and make a small hyperdrive that can only take a ship within a system in minutes. What would usually take hours to reach in a system, would take only minutes or less. Since the design, and creation of the Dark Avenger fighter, pirate attacks have reached an all time low. The in system nav computer allows the pilot to make a navigation/Astrogration roll for the micro-jump at a bonus of +2D.

Craft: Galamara Drives GV-14 Dark Avenger

Type: Medium intercept/attack fighter

Scale: Starfighter

Length: 11.4 meters

Crew: 1

Cargo Capacity: 20 kilograms

Consumables: 3 days

Cost: 160,000 (new)

Availability: R, 3, X

Nav Computer: Yes

Hyperdrive Multiplier: None

Microjump-Drive Multiplier: x2 (see below)

Maneuverability: 2D+1

Space: 8

Atmosphere: 350; 1,000 kmh

Hull: 2D+2

Shields: 1D

Sensors

Passive: 20/1D+1

Scan: 36/1D+2

Search: 50/2D+1

Focus: 4/2D+2

Weapons:

2 Quad Blaster cannons

Fire Arc: Front

Skill: Starship gunnery

Fire Control: 2D

Space Range: 2-4/10/20

Atmosphere Range: 200-400/1/2 km

Damage: 4D+2

Heavy Ion Cannon

Fire Arc: Front/top/rear

Skill: Starship gunnery

Fire Control: 3D

Space Range: 2-5/15/30

Atmosphere Range: 200-500/1.5/3 km

Damage: 4D

Microjump Drive

Type: Short range in system hyperdrive system

Design: Galamar drives Mark I Micro-drive system.

Cost: 15,000 credits

Basic Design Speed: x5, (Military version): x2

Game Notes: A micro-drive is designed to move a ship within a system in minutes instead of hours, or days. To calculate the time it would take to microjump in a system do the following.

Take the number of hours it would take to reach the destination, and turn it into minutes, then multiply that by the multiplier of the drive

Example: Gellick the Smuggler wants to reach Coruscant, he has arrived at a standard jump point three days away. He uses the micro-drive, and makes the jump.

72 hours to arrive standard= 360 minutes to jump there, so 6 hours.

Although it will still take time to arrive there, Gellick will get there a lot faster than anybody else will.
